

Haiti Communications Green Base Station Equipment Processing Factory

Overview

What is a green base station solution?

The green base station solution involves base station system architecture, base station form, power saving technologies, and application of green technologies. Using SDR-based architecture and distributed base stations is a different approach to traditional multiband multimode network construction.

What should a base station do in a wireless communications network?

In a wireless communications network, the base station should maintain high-quality coverage. It should also have the potential for upgrade or evolution. As network traffic increases, power consumption increases proportionally to the number of base stations. However, reducing the number of base stations may degrade network quality.

What is the difference between a traditional base station and SDR soft base station?

The biggest difference between a traditional base station and an SDR soft base station is that the Radio Frequency Unit (RU) of the soft base station is capable of software programming and redefining. So an SDR soft base station can intelligently allocate spectrum and support several standards.

Haiti Communications Green Base Station Equipment Processing Fa

ITU further strengthens Haiti's communications networks

ITU has already contributed 100 satellite terminals to Haiti to help rapidly re-establish basic communication links, as well as installing a Qualcomm Deployable Base ...
