

How many solar panels are needed for photovoltaics

Overview

While it varies from home to home, US households typically need between 10 and 20 solar panels to fully offset how much electricity they use throughout the year. The goal of most solar projects is to offset your electric bill 100%, so your solar system is sized to fit your average electricity use. How many solar panels do you need to power a house?

The goal for any solar project should be 100% electricity offset and maximum savings — not necessarily to cram as many panels on a roof as possible. So, the number of panels you need to power a house varies based on three main factors: In this article, we'll show you how to manually calculate how many panels you'll need to power your home.

How many kW solar panels do I Need?

As we calculated earlier, the California household needs a 7.2 kW system to cover its electricity needs. A comparable household in Massachusetts needs a 9.9 kW system. So, in less sunny areas like Massachusetts, you might consider choosing highly efficient solar panels to maximize your energy output per square foot.

How many solar panels are in a solar system?

Plugging our numbers in from above, we get: Number of panels = $10,791 \text{ kWh} / 1.1 \text{ or } 1.7 / 450 \text{ W}$. which gives us between 15 and 22 panels in a solar panel system, depending on which production ratio we use (15 for a 1.7 ratio and 22 for a 1.1 ratio).

How many solar panels do I need for a 5kW system?

If you are using only 400-watt solar panels, you will need 13 400-watt solar panels for a 5kW solar system ($13 \times 400 \text{ watts}$ is actually 5200 watts, so this is a 5.2kW system). Quite simple, right?

You can also mix solar panels with different wattages.

How much energy does a solar system use?

A 1,500-square-foot home would use an estimate of 630 kWh, whereas a 3,000-square-foot house would consume 1,200 kWh per month, twice as much. The national average for solar panels costs around \$16,000. However, some systems can run \$35,000 or more.

How many kilowatts of solar power does a house use?

The size of a house plays a major role in knowing how many kilowatts of solar power your panels will consume. A 1,500-square-foot home would use an estimate of 630 kWh, whereas a 3,000-square-foot house would consume 1,200 kWh per month, twice as much. The national average for solar panels costs around \$16,000.
