

Inverter sine wave IC model

Overview

Here we designed a simple sine wave inverter circuit that produces 50Hz quasi-sine wave output using a single IC CD4047 and some discrete components, which makes it a very cost-effective solution.

The low-battery indication circuit consists of transistor T9, preset VR2, Zener diode ZD2, resistors R5, R6, and R7, LED2, and capacitor C2. The 12V supply voltage from BATT.1 is applied to the low-battery.

If the battery is discharged to zero volts repeatedly, the battery life will decrease. The low-battery cut-off circuit consists of transistor T10, preset VR3, Zener diode ZD4, resistors R8 and R9, capacitor C3, and.

If there is no load connected to the output of the inverter, the output voltage is 270 to 290 volts. This voltage is sensed by the 0-12V tap at the secondary winding of inverter transformer X1, which is connected to the no-load cut-off circuit comprising Zener diode ZD5, transistor T11, preset VR4, resistors R12 and R11, and capacitor C4.

A very effective pure sine wave inverter circuit can be made using the IC 4047 and a couple IC 555 together with a few other passive components. I have explained the details below.

Inverter sine wave IC model
